In 2014, China was the biggest consumer as well as producer of coal globally. China is the third biggest country of coal resources in the world, behind Russia and the US, and its annual coal output and consumption rank number one in the world. Coal industry is the basic industry in China and it plays an important role in the construction of the Chinese economy and the development of the society. Nearly 75% of China's electricity production was derived from coal in 2014.

The Chinese coal industry has kept good development trends in recent years. The coal market is in great increase, the annual output result a record-breaking. But there are still many places where the demands exceeding supply. If Chinese national economy keeps the rapid development trends as the present, there will be great increase of coal output, sales and exports in the coming several years. However, coal's environmental legacy plagues the country's industry as China continues to face international pressure to deal with the environmental problems emerging from its abundant coal industry.
