Abstracts

Heat conductive paste, also known as thermal paste or thermal interface material (TIM), is a thermally conductive compound applied between heat-generating components (such as CPUs, GPUs, or power electronics) and heat sinks to enhance thermal transfer by filling microscopic air gaps, thereby reducing thermal resistance and preventing overheating. Its formulation typically includes a matrix of silicone, epoxy, or synthetic oil infused with high-thermal-conductivity fillers like ceramic particles (e.g., aluminum oxide, zinc oxide), metal oxides, or advanced materials such as boron nitride or silver, with performance varying based on viscosity, thermal conductivity (measured in W/m?K), and electrical insulation properties. This product is essential in electronics cooling applications, ranging from consumer devices to industrial and automotive systems, where efficient heat dissipation is critical for reliability and performance.

The global Heat Conductive Paste market size was estimated at USD 483.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
