Abstracts

An air depolarized battery is an electrochemical power source that utilizes atmospheric oxygen as the cathode reactant, typically employing zinc as the anode and an alkaline electrolyte, which allows oxygen from the air to diffuse into the cell and be reduced at the cathode, thereby extending energy capacity while reducing weight and material costs compared to conventional batteries that contain all reactive components internally. This technology is particularly advantageous for applications requiring long operational life and low weight, such as in hearing aids, medical devices, remote sensors, and safety equipment, where continuous or intermittent low-power discharge is needed without frequent replacement, leveraging the virtually unlimited supply of oxygen from the environment to sustain the electrochemical reaction efficiently.

The global Air Depolarized Battery market size was estimated at USD 310.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.75% during the forecast period.
