Report Overview

Anti-VEGF (vascular endothelial growth factor) medicines are biologic drugs designed to inhibit the activity of VEGF, a protein that stimulates abnormal blood vessel growth and leakage in conditions such as age-related macular degeneration (AMD), diabetic retinopathy, and retinal vein occlusion. These drugs, administered via intravitreal injection, work by binding to VEGF molecules, preventing them from interacting with receptors on blood vessel cells, thereby reducing edema and slowing disease progression. Key products in this class include ranibizumab (Lucentis), aflibercept (Eylea), and bevacizumab (Avastin, used off-label). The market is driven by the rising prevalence of retinal diseases, an aging population, and advancements in biologic therapies. However, high treatment costs, stringent regulatory requirements, and competition from biosimilars present challenges. Emerging innovations, such as longer-acting formulations and gene therapies, are shaping future growth in this specialized pharmaceutical segment.

The global Anti Vegf Medicine market size was estimated at USD 13865.49 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.87% during the forecast period.
