Abstracts

Betamethasone 21 acetate is a synthetic corticosteroid derivative of betamethasone, characterized by the acetylation at the 21-carbon position, which enhances its lipophilicity and potency. Primarily used in topical formulations such as creams, ointments, and lotions, it functions as an anti-inflammatory and immunosuppressive agent for treating various dermatological conditions, including eczema, psoriasis, contact dermatitis, and allergic reactions. Its mechanism involves inhibiting the release of inflammatory mediators and reducing edema, erythema, and pruritus. Due to its esterification, it exhibits improved skin penetration and a prolonged duration of action compared to non-esterified corticosteroids, making it a preferred option in moderate to severe inflammatory skin disorders, though its use requires careful monitoring to avoid adverse effects like skin atrophy or systemic absorption.

The global Betamethasone 21 Acetate market size was estimated at USD 550.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
