Abstracts

Bi Level Pressure Devices, also known as BiPAP (Bilevel Positive Airway Pressure) machines, are non-invasive ventilatory support devices used primarily for respiratory conditions such as obstructive sleep apnea, chronic obstructive pulmonary disease (COPD), and respiratory failure. These devices deliver two distinct pressure levels: a higher pressure during inhalation (IPAP) to assist airflow into the lungs and a lower pressure during exhalation (EPAP) to maintain airway patency without causing discomfort. Unlike continuous positive airway pressure (CPAP) machines, which provide a single fixed pressure, BiPAP devices offer greater flexibility and comfort for patients requiring higher pressure support or those who struggle with exhaling against constant pressure, making them particularly suitable for individuals with complex respiratory needs or comorbidities. The technology often includes advanced features such as ramp settings, humidity control, and data tracking to optimize patient adherence and therapeutic outcomes.

The global Bi Level Pressure Devices market size was estimated at USD 1723.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
