Abstracts

Blue green algae sensors are specialized environmental monitoring devices designed to detect and quantify the presence of cyanobacteria, commonly known as blue-green algae, in water bodies through various measurement techniques such as fluorescence, optical density, or chlorophyll-a detection, providing real-time or near-real-time data on algal concentrations to support early warning systems for harmful algal blooms (HABs), which pose risks to aquatic ecosystems, public health, and water-dependent industries. These sensors are deployed in diverse settings including lakes, reservoirs, coastal areas, and drinking water intakes, utilizing technologies like in-situ probes, remote sensing platforms, or integrated buoy systems that may also measure ancillary parameters such as temperature, pH, and dissolved oxygen to contextualize algal growth dynamics, thereby enabling proactive management and regulatory compliance for water quality authorities, municipal utilities, agricultural operations, and environmental research institutions.

The global Blue Green Algae Sensors market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.15% during the forecast period.
