Abstracts

A composite current collector is a critical component in advanced energy storage systems, particularly lithium-ion batteries, designed to replace traditional metal foils (such as aluminum for cathodes and copper for anodes) with a multilayer structure that typically integrates a polymer substrate coated with a thin conductive metal layer. This configuration aims to reduce weight, enhance mechanical flexibility, improve safety by mitigating internal short circuits, and increase energy density by allowing thicker active material layers or enabling the use of higher-capacity electrodes. By combining the electrical conductivity of metals with the lightweight, corrosion-resistant, and insulative properties of polymers, composite current collectors address key limitations of conventional foils, such as susceptibility to dendrite penetration, poor thermal stability, and trade-offs between mechanical strength and mass, positioning them as an enabling technology for next-generation batteries in electric vehicles, portable electronics, and grid storage applications.

The global Composite Current Collector market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
