Abstracts

An electrostatic air purifier is a type of air-cleaning device that uses electrostatic attraction to remove airborne particles such as dust, pollen, pet dander, smoke, and mold spores from indoor air. Unlike traditional mechanical filters (e.g., HEPA filters), which physically trap particles, electrostatic purifiers employ an ionization process: air passes through an ionizing section where particles are charged, after which they are attracted to and collected on oppositely charged plates or media within the unit. Some models are washable and reusable, reducing long-term filter replacement costs, though they may produce trace amounts of ozone as a byproduct, which has raised health and regulatory considerations. These systems are often integrated into portable room units, HVAC systems, or standalone commercial air cleaners, targeting consumers seeking improved indoor air quality with lower maintenance overhead compared to disposable filter alternatives.

The global Electrostatic Air Purifier market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
