Abstracts

A floating brake caliper, also known as a sliding caliper, is a type of disc brake system where the caliper housing is mounted on pins or bushings that allow it to move laterally relative to the rotor; unlike fixed calipers, it typically uses a single piston on the inboard side, which, when hydraulic pressure is applied, pushes the inner brake pad against the rotor while simultaneously pulling the caliper body to apply the outer pad, creating the clamping force necessary for braking. This design offers advantages in cost, weight, and packaging simplicity compared to fixed calipers, making it widely used in mainstream passenger vehicles, though it may be less rigid and provide slightly less consistent performance under extreme conditions.

The global Floating Brake Caliper market size was estimated at USD 3580.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
