Abstracts

GIP-1 receptor agonists are a class of injectable medications that mimic the action of the incretin hormone glucose-dependent insulinotropic polypeptide (GIP) and, in some dual-agonist formulations, also glucagon-like peptide-1 (GLP-1). They function by binding to and activating GIP receptors, which are primarily located in pancreatic beta cells, adipose tissue, and the central nervous system. This activation promotes glucose-dependent insulin secretion, suppresses glucagon release, slows gastric emptying, enhances satiety, and in some cases supports weight loss and cardiovascular benefits. Originally developed for the management of type 2 diabetes, their therapeutic scope has expanded significantly due to demonstrated efficacy in obesity treatment and cardiovascular risk reduction, positioning them as multifunctional metabolic agents with broad clinical applicability.

The global Gip 1 Receptor Agonist market size was estimated at USD 16433.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.15% during the forecast period.
