Abstracts

Heat pump heating systems are energy-efficient devices that transfer thermal energy from a lower-temperature source (such as outdoor air, ground, or water) to a higher-temperature space for heating purposes, using a refrigeration cycle that can be reversed to provide cooling as well; they are categorized primarily by their heat source?air-source, ground-source (geothermal), or water-source?and are increasingly adopted as sustainable alternatives to conventional furnaces and boilers due to their ability to deliver more energy output than the electrical input consumed, leveraging renewable ambient heat.
