Abstracts

Hiv Point Of Care Testing (POCT) refers to diagnostic tests performed at or near the site of patient care, delivering rapid results?typically within minutes?to enable immediate clinical decision-making, treatment initiation, or counseling. These tests are designed for simplicity, portability, and ease of use, often utilizing technologies like lateral flow immunoassays to detect HIV antibodies, antigens, or nucleic acids from small samples such as blood, oral fluid, or urine. By decentralizing testing away from traditional laboratories, POCT expands access to underserved populations, supports epidemic control through early diagnosis, and reduces loss to follow-up by integrating screening into routine healthcare visits, outreach programs, and self-testing contexts.

The global Hiv Point Of Care Testing market size was estimated at USD 912.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
