Abstracts

Hypereutectic Al-Si alloy refers to a class of aluminum-silicon alloys where the silicon content exceeds the eutectic composition, typically ranging from 14% to 20% silicon by weight, and in some specialized applications extending even higher. These alloys are characterized by their high wear resistance, low thermal expansion, and excellent mechanical properties at elevated temperatures, owing to the presence of primary silicon particles dispersed throughout the aluminum matrix. The hypereutectic composition is achieved through precise control of solidification processes and often involves modifications with elements like phosphorus to refine the silicon phase. Primarily used in automotive components such as engine blocks, pistons, and cylinder liners, these alloys offer a favorable balance of lightweight properties and durability, making them critical in applications demanding reduced weight, improved fuel efficiency, and enhanced performance under thermal and mechanical stress.

The global Hypereutectic Al Si Alloy market size was estimated at USD 850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
