Abstracts

An irrigated tip catheter is a specialized medical device used in electrophysiology procedures, particularly during cardiac ablation therapy, to treat arrhythmias such as atrial fibrillation; it features an internal irrigation system that continuously flushes the catheter tip with saline or other cooling fluids during radiofrequency (RF) energy delivery, which helps dissipate heat, prevent charring or coagulum formation on the electrode and tissue interface, maintain stable impedance, and enable deeper, more controlled lesion formation in cardiac tissue while minimizing the risk of complications like steam pops or thrombus.
