Abstracts

A manual rotary indexing table is a precision mechanical device used in manufacturing and machining applications to accurately rotate a workpiece to predefined angular positions for sequential operations such as drilling, milling, tapping, or inspection. It typically consists of a circular table mounted on a base, with a hand-operated crank or lever that engages a worm gear or similar mechanism to control rotation, often incorporating a locking system to secure the table at each indexed position. These tables are characterized by their robustness, simplicity, and reliability, offering high positional accuracy without the need for electrical power or complex programming, making them suitable for environments where automation is not required or where cost, durability, and ease of use are prioritized. Common configurations include horizontal, vertical, and tilting models, with indexing plates or dividing heads allowing for a variety of divisions (e.g., 24, 36, or 48 positions) to accommodate different machining tasks.

The global Manual Rotary Indexing Table market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
