Abstracts

Medical cervical collars are external orthopedic devices designed to immobilize, support, and protect the cervical spine, primarily used in trauma cases, postoperative recovery, and chronic neck conditions such as cervical spondylosis or whiplash injuries. These devices are typically constructed from soft or rigid materials like foam, polyethylene, or thermoplastic, and they function by restricting neck movement to prevent further injury, promote healing, and alleviate pain. The market includes both disposable collars for acute, short-term use in emergency settings and reusable models for long-term therapeutic applications, with variations in design catering to different levels of immobilization?from minimal support (soft collars) to maximum restriction (rigid collars). Key end-users encompass hospitals, emergency medical services, rehabilitation centers, and home care patients, driven by clinical guidelines and recommendations from healthcare professionals.
