Abstracts

Molded infrared (IR) aspheric lenses are optical components manufactured using precision molding techniques to create non-spherical surfaces that correct for spherical aberration and other distortions, specifically engineered to operate within infrared wavelength ranges (typically from 700 nm to over 14 ?m). These lenses are characterized by their complex, freeform geometries that enable superior performance in focusing, collimating, and imaging applications where weight, size, and optical efficiency are critical. They are primarily produced from materials such as chalcogenide glasses, germanium, zinc selenide, or silicon, which exhibit high transmission in IR spectra, and the molding process allows for high-volume, cost-effective production of consistent, high-precision optics compared to traditional grinding and polishing methods. Key applications include thermal imaging systems, military and aerospace targeting, automotive night vision, medical diagnostics, industrial process monitoring, and consumer electronics like gesture recognition and LiDAR, driving demand across defense, healthcare, automotive, and industrial sectors.

The global Molded Ir Aspheric Lenses market size was estimated at USD 152.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
