Abstracts

Multi Porous Bearings are a type of sliding bearing with a controllable pore structure manufactured through powder metallurgy or special sintering processes. The interconnected pore network inside can store lubricating media (oil, grease, or solid lubricants). During work, frictional heat causes lubricant to seep out of pores and form a lubricating film; After stopping operation, capillary action causes the lubricant to suck back, achieving self-lubricating circulation.

The global Multi Porous Bearings market size was estimated at USD 3116.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.20% during the forecast period.
