Abstracts

A packed bed wet scrubber is an air pollution control device designed to remove gaseous pollutants and particulate matter from industrial exhaust streams by passing the contaminated gas through a packed bed of inert media, such as plastic or ceramic packing materials, while simultaneously irrigating the bed with a scrubbing liquid?typically water or a chemical solution. As the gas flows upward through the packing, the large surface area provided by the media facilitates intimate contact between the gas and liquid phases, enabling mechanisms such as absorption, adsorption, and impaction to transfer pollutants from the gas stream into the liquid. This system is particularly effective for treating acid gases, soluble volatile organic compounds (VOCs), and fine particulates, offering advantages in removal efficiency, operational flexibility, and adaptability to various industrial processes, though it requires careful management of pressure drop, liquid distribution, and waste disposal.

The global Packed Bed Wet Scrubber market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
