Abstracts

Plant embedded insecticides, also known as systemic insecticides, are chemical or biological agents that are absorbed by plants through roots, stems, or foliage and translocated throughout their vascular systems, providing internal protection against insect pests by making plant tissues toxic or repellent to target insects; these products are distinct from topical or contact insecticides as they offer longer-lasting, systemic defense rather than surface-level application, and they are commonly used in agricultural, horticultural, and ornamental settings to control pests like aphids, whiteflies, and borers while minimizing environmental exposure and application frequency.

The global Plant Embedded Insecticides market size was estimated at USD 2450.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
