Abstracts

Subcutaneous biologics refer to therapeutic agents derived from living organisms, such as monoclonal antibodies, fusion proteins, and peptides, which are administered via injection into the subcutaneous tissue layer, typically using prefilled syringes, autoinjectors, or wearable delivery systems; this route of administration offers advantages over intravenous delivery, including improved patient convenience, reduced healthcare resource utilization, and the potential for self-administration, thereby enhancing treatment adherence and expanding access for chronic conditions like autoimmune diseases, oncology, and metabolic disorders. The market is characterized by a growing emphasis on patient-centric drug development, technological innovations in delivery devices, and an increasing number of biologics in development and approval pipelines that are specifically formulated for subcutaneous administration, driven by both pharmaceutical companies seeking to differentiate their products and healthcare systems aiming to lower treatment costs and shift care toward outpatient settings. Key growth factors include the rising prevalence of chronic diseases requiring long-term biologic therapy, advancements in formulation technologies that enable higher concentration dosing and reduced injection volumes, and strong patient preference for at-home administration, though challenges such as immunogenicity risks, limitations in bioavailability for certain large molecules, and the need for robust training and support for self-injection remain areas of ongoing research and commercial focus.

The global Subcutaneous Biologics market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
