Abstracts

Uninterruptible Power Supplies (UPS) in critical data centers refer to systems providing emergency power when the primary input source fails, ensuring continuous operation of servers, networking equipment, and other infrastructure without interruption. These systems range from small, single-device units to large, scalable solutions with advanced monitoring and management capabilities, designed to protect against power anomalies, including blackouts, brownouts, surges, and frequency variations. A UPS typically integrates batteries, inverters, and control mechanisms to deliver seamless power transition and sufficient runtime for either safe equipment shutdown or backup generator activation, making it indispensable for maintaining uptime, data integrity, and operational resilience in environments where even momentary power loss could result in significant financial, reputational, or safety consequences.

The global Ups In Critical Data Center market size was estimated at USD 12750.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
