Abstracts

A uterine tamponade system is a medical device designed to control postpartum hemorrhage (PPH) by applying internal pressure to the uterine walls, typically through the insertion and inflation of a balloon catheter within the uterine cavity. These systems are critical in obstetric emergencies where traditional methods, such as uterotonic medications or manual compression, prove insufficient to stop life-threatening bleeding. Available in various forms, including single- and double-balloon designs, they function by conforming to the uterine shape to exert uniform pressure, thereby compressing blood vessels and promoting hemostasis. The devices are often used in both resource-limited and advanced healthcare settings due to their effectiveness, relative ease of use, and potential to reduce the need for invasive surgical interventions like hysterectomy.

The global Uterine Tamponade System market size was estimated at USD 124.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
