These systems are designed to remove gases from sealed volumes to create a vacuum, utilizing a combination of mechanical pumps to achieve rough vacuum levels and high-vacuum pumps such as turbomolecular, cryogenic, or diffusion pumps to reach high and ultra-high vacuum conditions. They are critical in numerous industrial and scientific applications, including semiconductor manufacturing, where they evacuate process chambers; analytical instrumentation like electron microscopes and mass spectrometers; medical devices such as MRI machines; and packaging processes to extend shelf life. Performance is measured by parameters like ultimate pressure, pumping speed, and cleanliness to prevent contamination, with configurations often customized to meet specific pressure, gas load, and environmental requirements.

The global Vacuum Pumping Systems market size was estimated at USD 2780.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.82% during the forecast period.
