Abstracts

A wafer debonding system is a semiconductor manufacturing tool designed to delicately separate a thin wafer from a temporary carrier substrate to which it was bonded earlier in the fabrication process, typically during advanced packaging or 3D IC manufacturing stages where ultra-thin wafers require mechanical support for handling. These systems employ various debonding methods?such as thermal slide, laser lift-off, or mechanical peeling?to minimize stress, prevent wafer breakage, and preserve device integrity, ensuring high yield and throughput in the production of cutting-edge semiconductor devices like memory chips, processors, and sensors.
