Abstracts

A fluorescence photometer, also known as a fluorometer or fluorimeter, is an analytical instrument used to measure the fluorescence intensity and spectral properties of samples by exposing them to light at a specific wavelength and detecting the emitted light at a longer wavelength, leveraging the principle that certain compounds fluoresce when excited by light of an appropriate energy level. These instruments are critical in various scientific and industrial applications, including pharmaceuticals (for drug discovery and quality control), environmental monitoring (detecting pollutants and toxins), clinical diagnostics (biomarker detection and immunoassays), food safety (identifying contaminants or adulterants), and life sciences research (e.g., nucleic acid or protein quantification), offering high sensitivity and specificity for trace analysis.

The global Fluorescence Photometer market size was estimated at USD 325.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
