Abstracts

Sulfonylurea hypoglycemic drugs are commonly used in clinical oral hypoglycemic drugs, mainly used to treat type 2 diabetes. These drugs stimulate insulin secretion by specifically binding to sulfonylurea receptors on the pancreatic beta cell membrane, thereby achieving the effect of lowering blood sugar. The sulfonylurea group (-SO2NHCONH -) is the key structure for its hypoglycemic effect. This type of medication can be divided into three generations. The first generation includes tolbutamide and chlorpropamide, which have relatively high molecular weights and low specificity for receptor binding. They require large doses and are now less commonly used. The second generation includes glibenclamide, glipizide, gliclazide, and gliquidone. Compared with the first generation, the second generation drugs have smaller molecular weights, higher receptor binding specificity, require smaller doses, have stronger hypoglycemic effects, and relatively fewer adverse reactions. The third generation, represented by glimepiride, has further optimized molecular structure, higher receptor selectivity, longer drug action time, and relatively reduced risk of hypoglycemia.

The global Sulfonylurea Hypoglycemic Drugs market size was estimated at USD 21000.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.40% during the forecast period.
