Styrene Butadiene Rubber (SBR) is a kind of solid elastomer polymerized from 1,3-butadiene and styrene monomer.

According to the polymerization process, SBR can be classified as emulsion SBR (E-SBR), which takes up about 80% of the total, and solution SBR (S-SBR). According to different padding, SBR can be classified as OE-SBR, carbon black extended SBR and resin-filled SBR, etc.

SBR has excellent synthetic property and is one of the synthetic rubbers with highest output and consumption. SBR can be used for producing tires, rubber hose, rubber belts, rubber overshoes, electrical wire, cable and lots of other rubber products.

The SBR report is based on the data of the National Bureau of Statistics of China, China Petroleum and Chemical Industry Association, China Customs and the research network of Beijing Compass-info. The report mainly analyzes the SBR output, production capacity, down-stream demand, and predicts the future's market trend. It provides important decision support to the enterprises and research institutions that are intended to enter the SBR market.
