Abstracts

EPS Power, commonly referred to as EPS (Electric Power Steering), is a technology that uses an electric motor to assist the driver when turning the steering wheel. Unlike traditional hydraulic power steering systems, which rely on a hydraulic pump driven by the engine, EPS uses an electric motor to provide the necessary torque to turn the wheels. In an EPS system, the amount of assistance provided to the driver is variable and can be controlled more precisely by an onboard computer. This computer receives inputs from sensors monitoring the vehicle's speed, steering angle, and sometimes other factors like road conditions or driving style. As a result, EPS can offer improved fuel efficiency because it only consumes energy when the steering wheel is turned, unlike hydraulic systems that continuously draw power from the engine.

According to our (Global Info Research) latest study, the global EPS Power market size was valued at US$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
