Abstracts

According to our (Global Info Research) latest study, the global Metal Miniaturization Filter market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

Due to the introduction of the Massive MIMO function, the installation position of base station filters in 5G base stations has undergone significant changes. At the same time, it is required that base station filters be miniaturized and lightweight. Miniaturized metal filters have become an important choice for 5G base stations in filter products. The Massive MIMO AAU technology will bring about an exponential increase in the antenna array, and the RRU will be moved up to the sky surface (4G RRUs generally weigh 20-30kg, with the lightest being 10kg), resulting in an increase in the number and weight of the base station"s sky surface, requiring the filter to reduce weight; Massive MIMO has brought about a surge in the number of channels, with the original 2/4/8 channels being expanded to 64/128/256 channels. The required filter units have also increased, requiring a reduction in filter volume.
