Report Overview

The superheater is a part in the boiler that further heats the steam from the saturated temperature to the superheated temperature, and is one of the most important pressure-bearing and heat-exchanging parts of the boiler. The heating surface of the superheater is exposed to high temperature, high pressure and complex flue gas environment for a long time, so it is very vulnerable to corrosion and wear. The surfacing superheater uses the surfacing technology to deposit alloy materials with certain performance on the outer side of the superheater tube, so that the outer side of the superheater tube has special properties such as anti-corrosion, anti-wear, high temperature resistance, and high pressure resistance.
