Abstracts

Metasurface spectrometer is a miniature spectrometer that utilizes the modulation of light by ultra-surface arrays to realize spectroscopy. Ultra-surface technology, combined with computational reconstruction algorithms, allows more spectral information to be sampled with fewer broadband filters, which results in a system with higher signal-to-noise ratio and resolution. Compared with the traditional spectrometer, the metasurface spectrometer has the advantages of very small size, very low cost, small inter-stage difference, etc., which can be widely used in the field of cell phone, environmental protection, robot sensing, etc..

According to our (Global Info Research) latest study, the global Metasurface Spectrometer market size was valued at US$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
