Abstracts

The global Ultrasonic Focusing Transducer market size is expected to reach $ 366 million by 2032, rising at a market growth of 5.1% CAGR during the forecast period (2026-2032).

An ultrasonic focusing transducer is a device that converts electrical energy into ultrasonic waves and uses acoustic structures to focus the energy into a specific focal region. Through curved piezoelectric elements, acoustic lenses, or reflector structures, it concentrates ultrasonic energy at a defined focal point to enhance detection accuracy or enable localized energy delivery. It is widely used in medical therapy, non-destructive testing, and precision processing applications.

Upstream includes piezoelectric ceramics such as PZT, matching layer materials, backing materials, acoustic lenses or focusing structures, and driving power modules. Downstream applications include medical ultrasound systems, industrial non-destructive testing equipment, and ultrasonic processing machinery. The overall industry gross margin typically ranges from 35% to 55%, with higher margins for medical-grade and high-precision customized products.

In 2025, the global production of ultrasonic focusing transducers was 310,000 units, with an average price of $800 per unit.
