Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on VOCs Gas Chromatograph competitive dynamics, regional economic interdependencies, and supply chain reconfigurations.Volatile Organic Compounds (VOCs) refers to the general term for organic chemical substances that are volatile at room temperature and pressure, with high vapor pressure, and the number of carbon atoms generally does not exceed 9. They mainly include various aliphatic and aromatic alkanes, alkenes, oxygenated hydrocarbons and halogenated hydrocarbons, such as benzene, toluene, dichloromethane, formaldehyde and ethyl acetate. VOCs are generally highly irritating and toxic, some of which are teratogenic, carcinogenic and mutagenic, and a considerable number of them have bad odors, are flammable and explosive, etc. Some VOCs are highly photochemically active and are important precursors of ozone and secondary organic aerosols. Halogenated hydrocarbon VOCs can destroy the ozone layer and cause global environmental problems such as the greenhouse effect. The large amount of VOCs emitted by industry and life have a great impact on human and biological health and the ecological environment. The VOCs online monitoring system is mainly aimed at monitoring and early warning of unorganized emissions of industrial waste gas (including organic waste gas), using advanced industrial sensor network technology, automatic control, wireless communication, geographic information system, database, etc. to monitor the hazardous waste gas situation in chemical parks in real time, and realize the digital management of monitoring information from collection, transmission, analysis, processing to transmission and sharing, forming a perfect monitoring and early warning system, and promoting the modernization of environmental protection business management.
