The upper limb intelligent feedback training system, also known as the upper limb rehabilitation robot, is an advanced rehabilitation equipment that combines computer virtual technology and rehabilitation medicine theory. It simulates the movement of human upper limbs in real time, allowing patients to carry out multi-joint or single-joint rehabilitation training in a computer virtual environment. This training system not only increases the patient's interest and facilitates the rehabilitation process, but also tracks the patient's training progress and provides high-quality feedback, thereby helping the patient to better recover upper limb function. Upper limb rehabilitation robots have a wide range of applications, including but not limited to the treatment of upper limb dysfunction or defects caused by stroke, severe brain injury or other neurological disorders. Through clear treatment goals and targeted training, the upper limb function of patients can be effectively improved ?.
