Abstracts

According to our (Global Info Research) latest study, the global Catalysts for Renewable Fuel market size was valued at US$ 227 million in 2025 and is forecast to a readjusted size of US$ 370 million by 2032 with a CAGR of 7.6% during review period.

Catalysts for Renewable Fuel are specialized catalysts used to convert low-carbon feedstocks?such as vegetable oils, animal fats, waste cooking oils, lipid waste, biomass-derived oils, syngas, CO?, and green hydrogen?into hydrocarbon fuels like renewable diesel, Sustainable Aviation Fuel (SAF), bio-naphtha, and synthetic fuels. Their core functions include protection against feedstock impurities, hydrodeoxygenation, hydrogenation (saturation), isomerization, dewaxing, and hydrocracking/syngas conversion.

Upstream materials primarily consist of alumina, molecular sieves, silica-alumina materials, titanosilicates, activated carbon, binders, and metal salts/carrier materials (including nickel, molybdenum, cobalt, tungsten, platinum, and palladium); some products also incorporate precious metals, modified molecular sieves, and specialized shaping additives. Midstream processes involve carrier preparation, metal impregnation, drying and calcination, extrusion, activation, graded loading, and catalyst system design. Downstream applications primarily include HVO, HEFA-SAF, renewable diesel, bio-jet fuel, and FT synthetic fuels.

In 2025, global sales volume is projected to be approximately 5,800 metric tons, with a mainstream ex-factory price of around $38/kg and gross margins for major manufacturers ranging from 32% to 48%.
