Abstracts

The global Copper-based Arsenic Removal Adsorbent market size is expected to reach $ 23.26 million by 2032, rising at a market growth of 4.0% CAGR during the forecast period (2026-2032).

Copper-based Arsenic Removal Adsorbents are fixed-bed purification materials composed primarily of copper oxide or copper-containing composite oxides as the active components, supported on porous materials such as activated alumina. They primarily remove arsine (AsH?) from gaseous or liquid hydrocarbon streams via chemisorption while simultaneously removing phosphine (PH?), hydrogen sulfide (H?S), and carbonyl sulfide (COS). By reducing impurity levels to the ppb range, they protect downstream catalysts used in selective hydrogenation, polymerization, and precious metal-based processes.

The upstream segment of the industry chain comprises copper sources (e.g., copper oxide, copper nitrate, basic copper carbonate), supports (e.g., activated alumina, silica-alumina materials), composite components (e.g., zinc oxide, manganese oxide), and additives such as binders, pore-forming agents, and molding aids. Midstream enterprises manufacture the fixed-bed products through processes including impregnation, co-precipitation, aging, drying, calcination, and shaping (into spheres, tablets, or extrudates). Downstream applications are concentrated in oil refining, steam cracking, FCC, MTO/MTP, and polyolefin units; these agents are typically installed upstream of selective hydrogenation or polymerization catalysts, and spent products are generally disposed of as arsenic-containing hazardous waste.

Global sales volume is projected to reach approximately 2,300 metric tons in 2025, with an average selling price of roughly US$6,000–9,000 per ton and gross margins for
