Abstracts

According to our (Global Info Research) latest study, the global Ultra-Low-Alpha Spherical Fused Silica market size was valued at US$ 319 million in 2025 and is forecast to a readjusted size of US$ 555 million by 2032 with a CAGR of 8.2% during review period.

Ultra-low-alpha spherical fused silica is a high-purity silica filler produced through fusion, spheroidization, classification and stringent radioactive-impurity control. It combines extremely low alpha-particle emission with high sphericity, controlled particle-size distribution, low thermal expansion and good flow at high filler loading, making it suitable for advanced semiconductor encapsulation systems where soft-error risk, package reliability and dimensional stability are critical. In 2025, global Ultra-Low-Alpha Spherical Fused Silica production reached approximately 17,200 tons.

Advanced logic, HBM and high-density packaging continue to tighten requirements for low soft-error rates and low-radioactivity encapsulation materials, expanding ultra-low-alpha fillers beyond a narrow set of high-reliability applications.

Larger packages, higher die stacks and thinner structures make warpage, thermal stress and mold-flow control more difficult, increasing the value of fused silica with high sphericity, low thermal expansion and high loading capability.

Advanced packaging supply chains increasingly emphasize lot-to-lot consistency, trace-element and radioactive-impurity control, and localized supply, favoring manufacturers with integrated purification, spheroidization and precision-classification capabilities.
