Abstracts

The global anti-obesity medication market size was valued at USD 19.5 billion in 2025 and is projected to grow from USD 25.7 billion in 2026 to USD 176.4 billion by 2033, growing at a CAGR of 31.7% from 2026 to 2033. North America dominated the market, accounting for a revenue share of 37.0% in 2025. Increasing awareness of the health consequences of being overweight fuels market growth. In addition, the rising adoption of highly effective GLP-1 receptor agonists and next-generation weight loss therapies is significantly accelerating market expansion.

Accelerated development of anti-obesity drugs, supported by significant R&D investments, is expected to drive market growth. With advancements in drug development technologies, the market is poised for further growth, addressing the pressing need to combat overweight-related health challenges. In March 2025, the World Obesity Federation published the World Obesity Atlas, which projects that the number of obese adults will grow by more than 115% from 2010 to 2030, rising from 524 million to around 1.13 billion. The report states that two-thirds of countries lack most key national obesity policies, and only 7% have health systems adequately prepared to address obesity.

Furthermore, overweight and obesity are associated with approximately 1.6 million premature deaths annually from conditions including diabetes, cancer, heart disease,

and stroke. The growing burden of obesity and inadequate healthcare preparedness is expected to accelerate demand for pharmacological interventions, thereby supporting market expansion. Moreover, the projected increase in obesity prevalence directly correlates with market growth, creating opportunities for pharmaceutical companies, healthcare providers, and other stakeholders. As healthcare costs associated with obesity continue to escalate, there is a growing imperative for innovative solutions and interventions to curb this epidemic and ensure sustainable healthcare cost containment.

Market players are actively investing in R&D to develop innovative medicines for weight management. For instance, in October 2025, Eli Lilly reported successful topline results from the Phase III trial, in which oral GLP-1 receptor agonist orforglipron achieved significant weight reduction and improvements in cardiometabolic risk factors in adults with obesity or overweight. These advancements are expected to intensify competition, broaden therapeutic options, and accelerate market growth.

The introduction of new medications such as CagriSema, Oral Sema Obesity, GELA, INV-202, and orforglipron is propelling the market growth. Investing in this sector enables companies to seize opportunities arising from evolving demands and gain a competitive edge. Leading the development and commercialization of innovative medications positions companies as frontrunners, consolidating their market presence.
