According to our (Global Info Research) latest study, the global Hydroxy Trace Elements Feed Additives market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

Hydroxy trace minerals are a particular category of minerals, characterised by the presence of covalent bonds that constitute a single matrix with a crystalline structure that has an excellent molecule stability and an uniform distribution of particles. Hydroxy trace minerals are characterized by their strong intramolecular bonds in comparison to the weak ionic bonds of sulphates and most of the organic minerals. Strong bonds provide excellent stability and low reactivity in the rumen and a slow release effect in the intestinal tract.
