According to our latest research, the global Hypersonic Missiles market size will reach USD million in 2030, growing at a CAGR of % over the analysis period.

Missiles are self-propelled precision-guided munition systems and essential part of a country’s firearm inventory. They constitute of four system components, which are targeting or missile guidance system, flight system, engine, and warhead. Missiles are classified as subsonic, supersonic, and hypersonic systems depending on the speed at which they travel. Subsonic systems travel at a speed of Mach 0.8 and are known for dodging obstacles and being fuel efficient. They also have higher payload-carrying capacity. The technology for the development of subsonic missiles is quite matured, and countries have capitalized the building of such systems.

The Hypersonic Missiles market report provides a detailed analysis of global market size, regional and country-level market size, segmentation market growth, market share, competitive Landscape, impact of domestic and global market players, value chain optimization, trade regulations, recent developments, opportunities analysis, strategic market growth analysis, product launches, area marketplace expanding, and technological innovations.

The latest trend gaining momentum in the market is emergence of scramjet technology. Propulsion system plays a critical role in determining the range, payload, and speed of a missile. The major propulsion systems currently used in rockets and missiles are turbofans, turbojets, and ramjets. Supersonic systems, which travel at a speed of Mach 2-4, run on the ramjets technology. However, in the recent years, there is an increasing need for rockets with higher speeds. This has led to the development of a new propulsion system called scramjet, or Supersonic Combustion Ramjet.
