Abstracts

According to our (Global Info Research) latest study, the global Industrial Robot Vision Systems market size was valued at USD 8138.3 million in 2023 and is forecast to a readjusted size of USD 12130 million by 2030 with a CAGR of 5.9% during review period.

Add a vision system to a robot and you give it eyes, the robot can find objects in its working envelope — reducing the need for complex and expensive fixtures. This increases the flexibility of robotic automation, adapting to variation in part size, shape and location — ultimately reducing cell complexity. By adding a vision system robot palletizing and de-palletizing becomes practical, components can be assembled, dies unloaded, and parts lifted off racks and out of bins. It's even possible to track and pick parts in motion on a conveyor.

Robotic vision systems consist of one or more cameras, special-purpose lighting, software, and a robot or robots. The camera takes a picture of the working area or object the robot will grip and software searches the image for features that let it determine position and orientation. This information is sent to the robot controller and the programmed positions are updated. Depending on the application, the camera might be mounted on the robot or could be in a fixed position within the cell. Calibration is usually needed to relate the vision system coordinate space to the robot. Robot companies like FANUC offer robotic vision systems with vision software tightly integrated with the robot controller, so simplifying programming and use.
