Wireless communication, or sometimes simply wireless, is the transfer of information or power between two or more points that are not connected by an electrical conductor. The most common wireless technologies use radio waves. With radio waves distances can be short, such as a few meters for Bluetooth or as far as millions of kilometers for deep-space radio communications. It encompasses various types of fixed, mobile, and portable applications, including two-way radios, cellular telephones, personal digital assistants(PDAs), and wireless networking.

Wireless devices are used both in process and discrete industries for a wide applications, including easy maintenance, control, and monitoring. These devices are perceived as the next big technological step in industrial automation. However, their adoption has been moderate to date because of concerns over the robustness, reliability, and security of wireless technology. A need for automation in industries such as oil and gas, automotive, power, and textile has created need for industrial wireless.
