According to our (Global Info Research) latest study, the global Intrinsic Safety Modules market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Intrinsic safety (IS) is a protection technique for safe operation of electrical equipment in hazardous areas by limiting the energy, electrical and thermal, available for ignition. In signal and control circuits that can operate with low currents and voltages, the intrinsic safety approach simplifies circuits and reduces installation cost over other protection methods. Areas with dangerous concentrations of flammable gases or dust are found in applications such as petrochemical refineries and mines. As a discipline, it is an application of inherent safety in instrumentation. High-power circuits such as electric motors or lighting cannot use intrinsic safety methods for protection.

Intrinsic safety modules connect intrinsically safe rated equipment, such as transmitters, solenoids, proximity sensors and encapsulated assemblies, with control systems. An intrinsic safety approach can be more cost-effective than other hazardous location protection/mitigation strategies in Class I, Division 1 (Zones 0 and 1) locations.

The Global Info Research report includes an overview of the development of the Intrinsic Safety Modules industry chain, the market status of Oil and Gas (Zener Barriers, Isolator Barriers), Mining (Zener Barriers, Isolator Barriers), and key enterprises in developed and developing market, and analysed the cutting-edge technology, patent, hot applications and market trends of Intrinsic Safety Modules.

Regionally, the report analyzes the Intrinsic Safety Modules markets in key regions.
