Abstracts

According to our (Global Info Research) latest study, the global Ionizing Radiation Sterilization market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

One way in which sterilization by way of irradiation may occur is when ionizing radiation is used. In the context of sterilization, ionizing radiation is a type of short wavelength, high intensity radiation that is used to destroy all microorganisms during sterilization. The forms of ionizing radiation used for sterilization are known as gamma irradiation, electron irradiation and x-ray irradiation.

The food industry has recently renewed it interest in the use of radiation for food preservation. It can be used to prevent spoilage in seafood by doses of 100 to 250 kilorads, in meats and poultry by doses of 50 to 100 kilorads, and in fruits by doses of 200 to 300 kilorads. In Europe, mil and other foods are often irradiated to achieve sterility. Especially high energy electron beams, is used for the sterilization pharmaceuticals and disposable dental and medical supplies, such as plastic syringes, surgical gloves, suturing materials, and catheters.

The Global Info Research report includes an overview of the development of the Ionizing Radiation Sterilization industry chain, the market status of Pharmaceutical (Gamma Irradiation, X-Ray Irradiation), Healthcare (Gamma Irradiation, X-Ray Irradiation), and key enterprises in developed and developing market, and analysed the cutting-edge technology, patent, hot applications and market trends of Ionizing Radiation Sterilization.
