According to our (Global Info Research) latest study, the global Lasers for Cleaning market size was valued at US$ 211 million in 2025 and is forecast to a readjusted size of US$ 455 million by 2032 with a CAGR of 11.7% during review period.

Laser cleaning is a method of removing contaminants from different types of material. The main scope of application of this technology is the cleaning of metals from corrosion. Laser cleaning systems are making their way as great alternatives to traditional surface cleaning methods likes chemical cleaning and abrasive blasting. Laser cleaning systems require the use of suitable lasers.

Automatic cleaning procedures, typically used to prepare surfaces for further industrial operations, must follow the modifications introduced by Industry 4.0. Furthermore, chemical solvents are used, which results in potentially dangerous vapors and liquid waste products, and abrasive blasting systems cause significant waste and damage to delicate surfaces. These issues prompted the adoption of surface cleaning solutions based on laser technology. The automotive industry has significantly contributed to the laser cleaning market, one of the prime driving factors. During the car manufacturing process, automotive developers look for an easy and quick way to treat composite parts before bonding to ensure the integrity of the frame’s structure.
