Abstracts

According to our (Global Info Research) latest study, the global Negative Dry Film Resist market size was valued at US$ 788 million in 2025 and is forecast to a readjusted size of US$ 1028 million by 2032 with a CAGR of 3.6% during review period.

Negative Dry Film Resist is a film-type photosensitive pattern transfer material based on photopolymerizable resin chemistry. It is usually supplied in roll form with a photosensitive layer, carrier film and protective film, and is laminated onto copper-clad laminates, printed circuit boards, IC substrates, wafers, lead frames or other functional substrates. After exposure, the exposed areas undergo photopolymerization or crosslinking and remain after development, while the unexposed areas are removed to form precise resist patterns. The material is then used in etching, plating, tenting, redistribution, copper pillar formation and other patterning processes.

In 2025, global Negative Dry Film Resist production reached approximately 915 million Sqm, with an average global market price of around US$ 837 per k Sqm

The upstream raw materials of Negative Dry Film mainly include acrylic resins, epoxy resins, alkali-soluble binders, photopolymerizable monomers, oligomers, photoinitiators, sensitizers, dyes, inhibitors, adhesion promoters, plasticizers, solvents, polyethylene terephthalate carrier film and polyethylene protective film. Representative upstream suppliers include Mitsubishi Chemical Group, Kuraray, Arkema, BASF, etc.

The downstream applications of Negative Dry Film Resist mainly include PCB, Semiconductor Packaging and Others. Representative downstream customers include Zhen Ding Technology, Unimicron, Compeq, Tripod Technology, TTM Technologies,

etc.

The gross margin of Negative Dry Film Resist varies by film thickness, application field, customer qualification level and product performance grade. Typical gross margins is about 25%?50%.

By product type, Negative Dry Film Resist can be divided into Ultra-thin Dry Film, Thin Dry Film, Standard Dry Film and Thick Dry Film. Ultra-thin Dry Film refers to products with a thickness of ?15 ?m and is mainly used in fine-line, high-density interconnect, IC substrate and advanced packaging applications where high-resolution patterning, coating uniformity, low defectivity, low residue and tight line-width control are required. Thin Dry Film refers to products with a thickness of 15?50 ?m and is an important product range for fine-line printed circuit boards, high-density interconnect boards, flexible boards and selected package substrates, balancing resolution, adhesion, development latitude and production efficiency. Standard Dry Film refers to products with a thickness of 50?100 ?m and is suitable for conventional circuit imaging, etching resistance, pattern plating and tenting processes, representing a mature and broadly used thickness range. Thick Dry Film refers to products with a thickness of >100 ?m and is mainly used in thick plating, copper pillars, micro-bumps, high-aspect-ratio structures, microstructure fabrication and selected specialty packaging applications, where thickness stability, sidewall profile, plating resistance and stripping performance are more demanding.

By application, PCB is the largest and most established application area for Negative Dry Film Resist. In this field, the material is used for circuit imaging, etching resistance, pattern plating and tenting in rigid boards, flexible boards, rigid-flex boards, high-density interconnect boards and multilayer boards, with strong requirements for cost control, yield, lamination stability, development window and lot-to-lot consistency. Semiconductor Packaging is the most technology-driven application area, where Negative Dry Film Resist is used in IC substrates, redistribution layers, copper pillars, micro-bumps, fan-out packaging and other advanced packaging structures. This segment requires finer resolution, lower defect density, lower metal contamination, thicker film formation, stronger plating resistance and higher reliability.

Market Driving Factors are mainly supported by the increasing density and miniaturization of electronic products, which create stronger demand for fine-line patterning materials; the transition of printed circuit boards toward high-density interconnect, multilayer, flexible and high-reliability structures, which continuously increases the consumption of stable pattern transfer materials; the development of

semiconductor packaging technologies such as advanced packaging, fan-out packaging, redistribution layers, copper pillars and micro-bumps, which drives demand for ultra-thin, thin and thick high-end negative dry films; the growth of artificial intelligence servers, high-performance computing, automotive electronics, new energy vehicles, communications equipment and premium consumer electronics, which expands demand for high-end circuit boards and package substrates; the adoption of laser direct imaging, stepper exposure, automated lamination and continuous production processes, which raises requirements for photosensitivity, film thickness consistency and lot stability; the increasing focus on yield improvement, low defectivity, environmentally responsible processing and supply chain stability, which supports the replacement of low-end materials with high-quality Negative Dry Film Resist; and the localization of electronic materials and regional supply chain restructuring, which create entry opportunities for domestic suppliers in mid- to high-end customer systems.

Market Restraints mainly include the high technical barriers in high-end Negative Dry Film Resist formulation, as resin chemistry, photoinitiator systems, monomer balance, adhesion control, development latitude, stripping performance and defect control require long-term process know-how; long customer qualification cycles, especially in IC substrate and semiconductor packaging applications where materials must pass strict reliability, cleanliness, line-width control and mass-production stability validation; raw material price fluctuations in resins, photoinitiators, functional monomers, carrier films and protective films, which can affect production costs and gross margins; mature competition in standard dry films for general printed circuit boards, where price pressure may limit profitability in lower-end product grades; higher requirements for precision coating, cleanroom control, film thickness uniformity and process matching in ultra-thin and thick dry films, which increase research and quality-management costs; and cyclical fluctuations in consumer electronics, servers, automotive electronics and semiconductor capital expenditure, which can affect downstream order timing and create inventory volatility and short-term demand uncertainty.
