Abstracts

According to our (Global Info Research) latest study, the global Perimeter Intrusion Detection and Prevention market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Perimeter Intrusion Detection Systems (PIDS) are systems used in an external environment to detect the presence of an intruder attempting to breach a perimeter. The adoption of fiber optic Distributed Acoustic Sensing (DAS) technology is growing rapidly as part of PIDS strategies for a number of companies across a range of industries.

While there are several types of IDS, ranging in scope from single computers to large networks, the most common classifications are network intrusion detection systems (NIDS) and host-based intrusion detection systems (HIDS). A system that monitors important operating system files is an example of a HIDS, while a system that analyzes incoming network traffic is an example of a NIDS. It is also possible to classify IDS by detection approach: the most well-known variants are signature-based detection (recognizing bad patterns, such as malware) and anomaly-based detection (detecting deviations from a model of 'good' traffic, which often relies on machine learning). Some IDS have the ability to respond to detected intrusions. Systems with response capabilities are typically referred to as an intrusion prevention system.
