Abstracts

According to our (Global Info Research) latest study, the global Semiconductor-grade Photoresist Quencher market size was valued at US$ 74.08 million in 2025 and is forecast to a readjusted size of US$ 140 million by 2032 with a CAGR of 9.3% during review period.

Semiconductor-grade photoresist quenchers are low-loading basic or photodecomposable functional components used in chemically amplified resists to neutralize unwanted acid, control acid diffusion, and sharpen reaction boundaries, thereby improving contrast, line-edge roughness, and exposure process windows. Advanced grades require high purity, low volatility, precisely controlled basicity, and molecular-level compatibility with the PAG and resin system. In 2025, global Semiconductor-grade Photoresist Quencher production reached approximately 480 metric tons.

Demand for semiconductor-grade photoresist quenchers is primarily driven by tighter control of acid diffusion, stochastic defects, and line-edge roughness in ArF and EUV lithography. As advanced nodes tighten specifications for defects, trace metals, particles, film uniformity, and lot-to-lot consistency, qualification cycles become longer and supplier stickiness increases. Purification capability, formulation consistency, and joint qualification with leading fabs are therefore central competitive factors.

Future growth will also be supported by photodecomposable quenchers, PAG-PDQ molecular integration, and finer reaction control for High-NA EUV. As logic, memory, and advanced packaging flows become more complex, both the number of material-intensive process steps and the required performance per wafer increase. Localization,

supply-chain resilience, and environmental compliance will create openings for new suppliers, although scaled adoption will still depend on long-term reliability and high-volume manufacturing qualification.
